INTRODUCTION

Stizoides Guérin-Méneville, 1844 is a not numerous digger wasp genus included 30 species which inhabit all continents except Oriental, Australian, and Neotropical regions (Pulawski, 2012). The species of *Stizoides* are cleptoparasites in the nests of Orthoptera-hunting digger wasps of the genera *Sphex* Linnaeus, 1758, *Palmodes* Kohl, 1890, *Prionyx* Vander Linden, 1827 (Sphecidae), and *Stizus* Latreille, 1802 (Crabronidae) (Bohart & Menke, 1976; Ohl, 1999).

This genus was not especially studied in Russia, but there are species keys of European part of USSR (Pulawski, 1978), Kazakhstan and Middle Asia (Kazenas, 1978), and worldwide fauna (Ohl, 1999). The material used in this study is from the collections of Zoological Institute of Russian Academy of Sciences (St-Petersburg) and Institute of Biology and Soil Science of Russian Academy of Sciences (Vladivostok).

Genus *Stizoides* Guérin-Méneville, 1844

Stizoides Guérin-Méneville, 1844: 438 (as subgenus of *Stizus*). Type species: *Larra fasciata* Fabricius, 1798, junior secondary homonym of *Stizus fasciatus* (Fabricius, 1798) (= *Sphex assimilis* Fabricius, 1787), designated by J. Parker, 1929: 10.

Five species known in Russia and neighboring countries are included in the key.

Key to the species

..... *S. assimilis* (Fabricius)
- Forewing base infumate. Sternite II with regular macropunctures, without pubescent patch 2
2. Antennal base and legs black 3
- Antennal base and legs for the most part reddish-yellow 4

3. Forewing uniformly infumate. 12.0–22.0 mm *S. melanopterus* (Dahlbom)
 – Forewing apex with broad hyaline area. 11.5–21.0 mm *S. tridentatus* (Fabricius)
4. All tergites yellow or with broad yellow band. 12.5–16.0 mm
